Racial health disparities can't change until the health system

changes itself. Starting that transformation means shifting the way

that medical students are taught the interplay between race and

health. For far too long, medical schools have neglected to tackle

sample for antibody COVID-19 test. Misha Friedman for The New York Times

fueled those actions stubbornly lingers. A <u>2016 study</u> at one institution found that half of the medical students and residents surveyed agreed with one or more false statements about biological differences based on race, such as the idea that Black people had thicker skin and less sensitive nerve endings than their white counterparts.

The study only buttressed <u>earlier surveys</u> in which white

physicians consistently categorized Black patients as less

intelligent. Such false beliefs, left unchallenged, or worse, tacitly

reinforced by professors, can lead a new generation of doctors to

perpetuate discriminatory practices. To name just one example:

Black patients are <u>prescribed less pain medication</u> for injuries

whether Black people are more susceptible to Covid-19 because

A more nuanced approach, informed by public health, leads to exploring the real, underlying reasons the coronavirus has caused more destruction in Black communities: crowded multigenerational housing arrangements, more frequent use of public transportation and employment in newly hazardous frontline service jobs. In recent years, many medical schools have begun broadening

curriculums to include implicit bias and the social factors that

influence the health of diverse patient groups. But even the most dynamic lecture can be easily drowned out by the hundreds of hours students spend experiencing the broader informal curriculum in clinics and hospital, where myths about biological difference and behavioral pathology still linger.

So it's essential that we set up ways to ensure physician-educators

are also trained and periodically evaluated in a tangible and

we will continue to perpetuate the problem.

accountable way. That way they can pass along a more empathic

and open-minded approach to treating patients. And it's a task too

important to be relegated to a certain lecture or delegated to Black

faculty. If it doesn't involve every component of the medical school,
